Package 'gUtils'

November 6, 2017

Title R Package Providing Additional Capabilities and Speed for GenomicRanges Operations
Version 0.2.0
Description R package providing additional capabilities and speed for GenomicRanges operations.
Depends R (>= 3.1.0), GenomicRanges (>= 1.18), data.table (>= 1.9)
Imports IRanges (>= 2.0), S4Vectors (>= 0.4), GenomeInfoDb (>= 1.2), parallel, BiocGenerics(>= 0.12), methods, Matrix, stringr
Suggests BSgenome. Hsapiens. UCSC. hg19, testthat, rtracklayer
License GPL-2
<pre>BugReports http://github.com/mskilab/gUtils/issues</pre>
LazyData true
RoxygenNote 6.0.1.9000
NeedsCompilation no
Author Jeremiah Wala [aut], Marcin Imielinski [aut, cre]

anchorlift anchorlift

Description

"lifts" all queries with respect to subject in coordinates that are within "pad" i.e. puts the queries into subject-centric coordinates, which is a new genome with label "Anchor" (default)

Respects strand of subject (i.e. if subject strand gr is "-" then will lift all queries to the left of it into positive subject-centric coordinates). Keeps track of subject and query id for later deconvolution if need be.

Usage

```
anchorlift(query, subject, window = 1e+09, by = NULL, seqname = "Anchor",
  include.values = TRUE)
```

Arguments

query	GRanges that will be lifted around the subject
subject	GRanges around which the queries will be lifted
window	non-negative integer scalar specifying how far around each subject to gather query intervals to lift (default $1e9$)
by	character vector specifying additional columsn (e.g. sample id) around which to restrict overlaps (via gr.findoverlaps) (default NULL)
seqname	Character specifying the name of the output sequence around which to anchor (default "Anchor")
include.values	logical flag whether to include values from query and subject (default TRUE)

Author(s)

Marcin Imielinski

4 example_genes

dt2gr

Convert data.table to GRanges

Description

Takes as input a data.table which must have the following fields: start, end, strand, seqnames. Will throw an error if any one of these is not present. All of the remaining fields are added as metadata to the GRanges.

Usage

```
dt2gr(dt, key = NULL, seqlengths = hg_seqlengths(), seqinfo = Seqinfo())
```

Arguments

dt data.table to convert to GRanges

dt data.table to convert

Value

GRanges object of length = nrow(dt)

Examples

```
gr \leftarrow dt2gr(data.table(start=c(1,2), seqnames=c("X", "1"), end=c(10,20), strand = c('+', '-')))
```

example_dnase

DNAaseI hypersensitivity sites for hg19A

Description

DNAaseI hypersensitivity sites from UCSC Table Browser hg19, subsampled to 10,000 sites

Format

GRanges

example_genes

RefSeq genes for hg19

Description

RefSeq genes with exon count and name

Format

GRanges

gr.breaks 5

gr.breaks

Break GRanges at given breakpoints into disjoint gr

Description

Break GRanges at given breakpoints into disjoint gr

Usage

```
gr.breaks(bps = NULL, query = NULL)
```

Arguments

bps GRanges of width 1, locations of the bp; if any element width larger than 1, both

boundary will be considered individual breakpoints

query a disjoint GRanges object to be broken

Value

GRanges disjoint object at least the same length as query, with a metadata column qid indicating input index where new segment is from

Author(s)

Xiaotong Yao

gr.chr

Prepend "chr" to GRanges seqlevels

Description

Prepend "chr" to GRanges seqlevels

Usage

```
gr.chr(gr)
```

Arguments

gr

GRanges object to append 'chr' to

Value

Identical GRanges, but with 'chr' prepended to each seqlevel

Examples

```
gr \leftarrow gr.chr(GRanges(c(1,"chrX"), IRanges(c(1,2), 1)))
seqnames(gr)
```

gr.cov

Description

Like GenomicRanges::reduce except only collapses «adjacent» ranges in the input

Usage

```
gr.collapse(gr, pad = 1)
```

Arguments

gr GRanges to collapse

pad Padding that allows for not quite adjacent elements to be considered overlap-

ping. 1

Value

Collapsed ranges

Author(s)

Marcin Imielinski

gr.cov	gr.cov

Description

Sums granges either by doing coverage and either weighting them equally or using a field "weight". Will return either sum or average.

Most basic functionality is like an as(coverage(gr), 'GRanges')

Usage

```
gr.sum(gr, field = NULL, mean = FALSE)
```

Arguments

gr GRanges to sum

field metadata field from gr to use as a weight

mean logical scalar specifying whether to divide the output at each interval but the

total number of intervals overlapping it (only applies if field == NULL) (default

FALSE)

Value

non-overlapping granges spanning the seqlengths of gr with \$score (if field is NULL) or \$field specifying the sum / mean at that position

gr.dice 7

gr.dice	Dice up GRanges into width = 1 GRanges spanning the input (warn-
	ing can produce a very large object)

Description

Dice up GRanges into width = 1 GRanges spanning the input (warning can produce a very large object)

Usage

```
gr.dice(gr)
```

Arguments

gr

GRanges object to dice

Value

GRangesList where kth element is a diced pile of GRanges from kth input GRanges

Author(s)

Marcin Imielinski

Examples

```
gr.dice(GRanges(c(1,4), IRanges(c(10,10),20)))
```

gr.disjoin

GenomicRanges disjoin with some spice Identical to GRanges disjoin, except outputs inherit metadata from first overlapping parent instance on input

Usage

```
gr.disjoin(x, ..., ignore.strand = TRUE)
```

Arguments

x GRanges to disjoin... arguments to disjoinignore.strand logical scalar, default TRUE

8 gr.duplicated

gr	ᅬ	:	_	+
or	а	1	9	т

Pairwise distance between two GRanges

Description

Computes matrix of pairwise distance between elements of two GRanges objects of length n and m.

Usage

```
gr.dist(gr1, gr2 = NULL, ignore.strand = FALSE, ...)
```

Arguments

gr1	First GRanges
gr2	Second GRanges
ignore.strand	Don't required elements be on same strand to avoid NA [FALSE]
	Additional arguments to be supplied to GenomicRanges::distance

Details

Distances are computed as follows:

- NA for ranges on different seqnames
- 0 for overlapping ranges
- min(abs(end1-end2), abs(end1-start2), abs(start1-end2), abs(start1-end1),) for all others

If only gr1 is provided, then will return $n \times n$ matrix of gr1 vs itself If max.dist = TRUE, then will replace min with max above

Value

N by M matrix with the pairwise distances, with gr1 on rows and gr2 on cols

Author(s)

Marcin Imielinski

gr.duplicated Allows to restrict duplicates using "by" columns and allows matching	in exact
--	----------

Description

Allows to restrict duplicates using "by" columns and allows in exact matching

```
gr.duplicated(query, by = NULL, type = "any")
```

gr.end 9

Arguments

```
query query ranges
```

Examples

gr.end

Get the right ends of a GRanges

Description

Alternative to GenomicRanges::flank that will provide end positions *within* intervals

Usage

```
gr.end(x, width = 1, force = FALSE, ignore.strand = TRUE, clip = TRUE)
```

Arguments

X	GRanges object to operate on
width	Specify subranges of greater width including the start of the range. [1]
force	Allows returned GRanges to have ranges outside of its Seqinfo bounds. [FALSE]
ignore.strand	If set to FALSE, will extend '-' strands from the other direction. [TRUE]
clip	Trims returned GRanges so that it does not extend beyond bounds of the input GRanges. [TRUE]

Value

GRanges object of width = width ranges representing end of each genomic range in the input.

Author(s)

Marcin Imielinski

Examples

```
gr.end(example_dnase, width=200, clip=TRUE)
```

10 gr.findoverlaps

gr.findoverlaps	Wrapper to GenomicRanges::findOverlaps with added functionality
	·

Description

Returns GRanges of matches with two additional fields:

```
$query.id - index of matching query $subject.id - index of matching subject
```

Optional "by" field is a character scalar that specifies a metadata column present in both query and subject that will be used to additionally restrict matches, i.e. to pairs of ranges that overlap and also have the same values of their "by" fields

Usage

```
gr.findoverlaps(query, subject, ignore.strand = TRUE, first = FALSE,
  qcol = NULL, scol = NULL, type = "any", by = NULL,
  return.type = "same", max.chunk = 1e+13, verbose = FALSE,
  mc.cores = 1, ...)
```

Arguments

query	Query GRanges pile
subject	Subject GRanges pile
ignore.strand	Don't consider strand information during overlaps. [TRUE]
first	Restrict to only the first match of the subject (default is to return all matches). [FALSE]
qcol	character vector of query meta-data columns to add to results
scol	character vector of subject meta-data columns to add to results
type	<pre>type argument as defined by IRanges::findOverlaps("any", "start", "end", "within", "equal"). ["any"]</pre>
by	Meta-data column to consider when performing overlaps [NULL]
return.type	Select data format to return (supplied as character): "same", "data.table", "GRanges". ["same"]
max.chunk	Maximum number of query*subject ranges to consider at once. Lower number increases runtime but decreased memory. If length(query)*length(subject) is less than max.chunk, overlaps will run in one batch.[1e13]
verbose	Increase the verbosity. [FALSE]
mc.cores	Number of cores to use when running in chunked mode
	Additional arguments sent to IRanges::findOverlaps.

Value

 ${\tt GRanges\ pile\ of\ the\ intersection\ regions,\ with\ query.id\ and\ subject.id\ marking\ sources}$

gr.fix

gr.fix "Fixes" seqlengths / seqlevels

Description

If "genome" not specified will replace NA seqlengths in GRanges to reflect largest coordinate per seqlevel and removes all NA seqlevels after this fix.

Usage

```
gr.fix(gr, genome = NULL, gname = NULL, drop = FALSE)
```

Arguments

gi Granges object to its	ct to fix	obiec	GRanges	gr
--------------------------	-----------	-------	---------	----

genome Genome to fix to: Seqinfo, BSgenome, GRanges (w/seqlengths), GRangesList

(w/seqlengths)

gname Name of the genome (optional, just appends to Seqinfo of the output) [NULL]

drop Remove ranges that are not present in the supplied genome [FALSE]

Details

if "genome" defined (i.e. as Seqinfo object, or a BSgenome, GRanges, GRangesList object with populated seqlengths), then will replace seqlengths in gr with those for that genome

Value

GRanges pile with the fixed Seqinfo

gr.flatten	Lay ranges end-to-end onto a derivate "chromosome"
------------	--

Description

Takes pile of GRanges and returns into a data.frame with nrow = length(gr) with each representing the corresponding input range superimposed onto a single "flattened" chromosome, with ranges laid end-to-end

Usage

```
gr.flatten(gr, gap = 0)
```

Arguments

gr	GRanges to flatten
----	--------------------

gap Number of bases between ranges on the new chromosome [0]

Value

data. frame with start and end coordinates, and all of the original metadata

gr.in

gr.flipstrand

Flip strand on GRanges

Description

Flip strand on GRanges

Usage

```
gr.flipstrand(gr)
```

Arguments

gr

GRanges pile with strands to be flipped

Value

```
GRanges with flipped strands (+ to -, * to *, - to *)
```

Examples

```
 \mbox{gr.flipstrand(GRanges(1, IRanges(c(10,10,10),20), strand=c("+","*","-")))} \\
```

gr.in

Versatile implementation of GenomicRanges::over

Description

returns T / F vector if query range i is found in any range in subject

Usage

```
gr.in(query, subject, ...)
```

Arguments

```
query GRanges
subject GRanges
```

... Argument to be sent to gr.findoverlaps (e.g. by)

gr.match 13

gr.match	Alternative	GenomicRanges::match	that	accepts	additional
	gr.findove	rlaps options			

Description

Wrapper to GenomicRanges::match (uses gr.findoverlaps). This allows users to match on additional by fields, or chunk into smaller pieces for lower memory.

Usage

```
gr.match(query, subject, max.slice = Inf, verbose = FALSE, ...)
```

Arguments

query	Query GRanges pile
subject	Subject GRanges pile
max.slice	max slice of query to match at a time
verbose	whether to give verbose output
	Additional arguments to be passed along to gr.findoverlaps.

Value

Vector of length = length(query) with subject indices of *first* subject in query, or NA if none found. This behavior is different from gr.findoverlaps, which will return *all* indicies of subject in query (in the case of one query overlaps with multiple subject) ... = additional args for findOverlaps (IRanges version)

Author(s)

Marcin Imielinski

gr.merge merge GRanges using coordinates as primary key	
---	--

Description

Uses gr.findoverlaps to enable internal and external joins of GRanges using syntax similar to "merge" where merging is done using coordinates +/- "by" fields

Uses gr.findoverlaps / findOverlaps for heavy lifting, but returns outputs with metadata populated as well as query and subject ids. For external joins, overlaps x with gaps(y) and gaps(x) with y.

```
gr.merge(query, subject, by = NULL, all = FALSE, all.query = all,
all.subject = all, verbose = FALSE, ignore.strand = TRUE, ...)
```

14 gr.nochr

Arguments

query query ranges subject subject

by additional metadata fields to join on all whether to include left and right joins

all.query whether to do a left join all.subject whether to do a right join

gr.mid

Get the midpoints of GRanges ranges

Description

Get the midpoints of GRanges ranges

Usage

```
gr.mid(x)
```

Arguments

Χ

GRanges object to operate on

Value

GRanges of the midpoint, calculated from floor(width(x)/2)

Examples

```
gr.mid(GRanges(1, IRanges(1000,2000), seqinfo=Seqinfo("1", 2000)))
```

gr.nochr

Remove chr prefix from GRanges seqlevels

Description

Remove chr prefix from GRanges seqlevels

Usage

```
gr.nochr(gr)
```

Arguments

gr

GRanges with chr seqlevel prefixes

Value

GRanges without chr seqlevel prefixes

gr.pairflip 15

gr.pairflip

Create pairs of ranges and their strand-inverse

Description

From a GRanges returns a GRangesList with each item consisting of the original GRanges and its strand flip

Usage

```
gr.pairflip(gr)
```

Arguments

gr

GRanges

Value

 ${\sf GRangesList}$ with each element of length 2

gr.rand

Generate random GRanges on genome

Description

Randomly generates non-overlapping GRanges with supplied widths on supplied genome. Seed can be supplied with set.seed

Usage

```
gr.rand(w, genome)
```

Arguments

w Vector of widths (length of w determines length of output)

genome Genome which can be a GRanges, GRangesList, or Seqinfo object. Default is

"hg19" from the BSGenome package.

Value

GRanges with random intervals on the specifed "chromosomes"

Note

This function is currently quite slow, needs optimization

Author(s)

Marcin Imielinski

16 gr.sample

Examples

```
## Generate 5 non-overlapping regions of width 10 on hg19
gr.rand(rep(10,5), BSgenome.Hsapiens.UCSC.hg19::Hsapiens)
```

gr.sample

Randomly sample GRanges intervals within territory

Description

Samples k intervals of length "len" from a pile of GRanges.

- If k is a scalar then will (uniformly) select k intervals from the summed territory of GRanges
- If k is a vector of length(gr) then will uniformly select k intervals from each.

Usage

```
gr.sample(gr, k, wid = 100, replace = TRUE)
```

Arguments

gr	GRanges object	defining the terr	itory to samp	le from
----	----------------	-------------------	---------------	---------

k Number of ranges to sample

wid Length of the GRanges element to produce [100]

replace If TRUE, will bootstrap, otherwise will sample without replacement. [TRUE]

Value

GRanges of max length sum(k) [if k is vector) or k*length(gr) (if k is scalar) with labels indicating the originating range.

sample 5 GRanges of length 10 each from territory of RefSeq genes gr.sample(reduce(example_genes), k=5, wid=10)

Note

This is different from GenomicRanges::sample function, which just samples from a pile of GRanges

Author(s)

Marcin Imielinski

gr.simplify 17

	gr.simplify	Simplify granges by collapsing all non-overlapping adjacent ranges that share a given "field" value (adjacent == adjacent in the input GRanges object)
--	-------------	--

Description

Simplify granges by collapsing all non-overlapping adjacent ranges that share a given "field" value (adjacent == adjacent in the input GRanges object)

Usage

```
gr.simplify(gr, field = NULL, val = NULL, include.val = TRUE,
    split = FALSE, pad = 1)
```

Arguments

gr	takes in gr or grl
gı	takes in gr or gir
field	character scalar, corresponding to value field of gr. [NULL]
val	[NULL]
include.val	scalar logical, will include in out gr values field of first matching record in input gr. $[TRUE]$
split	Split the output into GRangesList split by "field". [FALSE]
pad	Pad ranges by this amount before doing merge. [1], which merges contiguous but non-overlapping ranges.

Value

Simplified GRanges with "field" populated with uniquely contiguous values

gr.start	Get GRanges corresponding to beginning of range
_	

Description

Get GRanges corresponding to beginning of range

Usage

```
gr.start(x, width = 1, force = FALSE, ignore.strand = TRUE, clip = TRUE)
```

Arguments

X	GRanges object to operate on
width	[default = 1] Specify subranges of greater width including the start of the range.
force	[default = F] Allows returned GRanges to have ranges outside of its Seqinfo bounds.
ignore.strand	If set to FALSE, will extend '-' strands from the other direction [TRUE].
clip	[default = F] Trims returned GRanges so that it does not extend beyond bounds of the input GRanges

18 gr.string

Value

GRanges object of width 1 ranges representing start of each genomic range in the input.

Examples

```
gr.start(example_dnase, width=200)
gr.start(example_dnase, width=200, clip=TRUE)
```

gr.string

Return UCSC style interval string corresponding to GRanges pile (ie chr:start-end)

Description

Return UCSC style interval string corresponding to GRanges pile (ie chr:start-end)

Usage

```
gr.string(gr, add.chr = FALSE, mb = FALSE, round = 3, other.cols = c(),
pretty = FALSE)
```

Arguments

gr GRanges pile to get intervals from add.chr Prepend seqnames with "chr" [FALSE]

mb Round to the nearest megabase [FALSE]

round If mb supplied, how many digits to round to. [3]

other.cols Names of additional mcols fields to add to the string (seperated by ";")

Author(s)

Marcin Imielinski

Examples

```
gr.string(example_genes, other.cols = c("name", "name2"))
```

gr.stripstrand 19

gr.stripstrand

gr.stripstrand

Description

Sets strand to "*"

Usage

```
gr.stripstrand(gr)
```

Arguments

gr

GRanges to remove strand information from

Value

GRanges with strand set to *

gr.sub

Apply gsub to seqlevels of a GRanges

Description

Apply gsub to seqlevels of gr, by default removing 'chr', and "0.1" suffixes, and replacing "MT" with "M"

Usage

```
gr.sub(gr, a = c("(^chr)(\.1$)", "MT"), b = c("", "M"))
```

Arguments

gr GRanges to switch out seqlevels for

a Vector of regular expressions of things to sub-out

b Vector of values to sub in

20 gr.tile.map

gr.tile	Tile ranges across GRanges	
---------	----------------------------	--

Description

Tiles interval (or whole genome) with segments of <= specified width.

Usage

```
gr.tile(gr, w = 1000)
```

Arguments

GRanges, seqlengths or Seqinfo range to tile. If has GRanges has overlaps, gr will reduce first.

Width of each tile W

Examples

```
## 10 tiles of width 10
gr1 <- gr.tile(GRanges(1, IRanges(1,100)), w=10)</pre>
## make them overlap each other by 5
gr1 + 5
```

gr.tile.map gr.tile.map

Description

Given two tilings of the genome (e.g. at different resolution) query and subject outputs a length(query) list whose items are integer vectors of indices in subject overlapping that overlap that query (strand non-specific)

Usage

```
gr.tile.map(query, subject, verbose = FALSE)
```

Arguments

query	Query GRanges pile, perhaps created from some tile (e.g. gr.tile), and as-
	sumed to have no gaps
subject	Subject GRanges pile, perhaps created from some tile (e.g. gr.tile), and as-

sumed to have no gaps

Increase the verbosity of the output verbose

Value

list of length = length(query), where each element i is a vector of indicies in subject that overlaps element i of query

gr.trim 21

Note

Assumes that input query and subject have no gaps (including at end) or overlaps, i.e. ignores end() coordinates and only uses "starts"

Author(s)

Marcin Imielinski

	ims pile of GRanges relative to the specified <local> coordinates of och range</local>
--	--

Description

Example: GRanges with genomic coordinates 1:1,000,000-1,001,000 can get the first 20 and last 50 bases trimmed off with start = 20, end = 950. if end is larger than the width of the corresponding gr, then the corresponding output will only have end(gr) as its coordinate.

Usage

```
gr.trim(gr, starts = 1, ends = 1)
```

Arguments

gr	Granges to trim
starts	Number of bases to trim off of the front[1]
ends	Number of bases to trim off of the back[1]

Details

This is a role not currently provided by the standard GenomicRanges functions (e.g. shift, reduce, restrict, shift, resize, flank)

Examples

```
## trim the first 20 and last 50 bases
gr.trim(GRanges(1, IRanges(1e6, width=1000)), starts=20, ends=950)
## return value: GRanges on 1:1,000,019-1,000,949
```

22 gr.val

gr.val Annotate GRanges with values from another GRanges	
--	--

Description

Annotates GRanges in query with aggregated values of GRanges in target in field val. If val is numeric: given target with value column target representing ranged data (i.e. segment intensities), then computes the value in each query GRanges as the weighted mean of its intersection with target (ie the target values weighted by the width of the intersections).

Usage

```
gr.val(query, target, val = NULL, mean = TRUE, weighted = mean,
na.rm = FALSE, by = NULL, by.prefix = val, merge = FALSE,
verbose = FALSE, FUN = NULL, default.val = NA, max.slice = Inf,
mc.cores = 1, ..., sep = ", ")
```

Arguments

query	$\ensuremath{GRanges}$ of query ranges whose val column we will populate with aggregated values of target
target	GRanges of target ranges that already have "val" column populated
val	If a character field: then aggregation will paste together the (unique), overlapping values, collapsing by comma. $[NULL]$
mean	Scalar logical flag. If FALSE then will return sum instead of mean, only applies if target ν al column is numeric.
weighted	Calculate a weighted mean. If FALSE, calculates unweighted mean. [TRUE]
na.rm	Remove NA values when calulating means. only applies if val column of target is numeric ${\tt [FALSE]}$
by	scalar character, specifies additional "by" column of query AND target that will be used to match up query and target pairs (i.e. in addition to pure GRanges overlap), default is $NULL$
by.prefix	Choose a set of val fields by a shared prefix.
merge	if merge = FALSE then will cross every range in query with every level of "by" in target (and create data matrix), otherwise will assume query has "by" and merge only ranges that have matching "by" values in both query and target
verbose	Increase the verbosity of the output
FUN	Optional different function to call than mean. Takes two arguments (value, na.rm = $TRUE$) if weighted = $FALSE$, and three (value, width, na.rm = $TRUE$) if weighted = $TRUE$
default.val	If no hit in target found in query, fill output val field with this value.
max.slice	Maximum number of query ranges to consider in one memory chunk. [Inf]
mc.cores	Number of cores to use when running in chunked mode
	Additional arguments to be sent to gr.findoverlaps.
sep	scalar character, specifies character to use as separator when aggregating character "vals" from target, only applies if target is character

gr2dt 23

Details

Applications include (among others):

• Querying the average value of target across a given query interval (e.g. exon to gene pileup)

• recasting a high res tiling in terms of low res intervals.

Usually query intervals are bigger than the target intervals.

Value

query with the val field populated

Note

query and target can be GRangesList object, in which case val will refer to GRangesList level values fields

Author(s)

Marcin Imielinski

gr2dt

Converts GRanges to data.table

Description

and a field grl.iix which saves the (local) index that that gr was in its corresponding grl item

Usage

```
gr2dt(x)
```

Arguments

Х

GRanges to convert

grbind

Concatenate GRanges, robust to different mcols

Description

Concatenates GRanges objects, taking the union of their features if they have non-overlapping features

```
grbind(x, ...)
```

24 grl.hiC

Arguments

x First GRanges

... additional GRanges

Value

Concatenated GRanges grbind(example_genes, example_dnase)

Note

Does not fill in the Seqinfo for the output GRanges

grl.eval	evaluate and aggregate expression on GRanges column in GRanges-
	List

Description

Evaluate expression expr on indivdual granges inside grangeslist. Expression should result in a single i.e. scalar value per grangeslist item.

Usage

```
grl.eval(grl, expr, condition = NULL)
```

Arguments

grl GRangesList to eval over

expr expression on columns of granges or granges list

condition optional expression (with logical or integer output) on columns of GRanges on

which to subset prior to evaluating main expr

grl.hiC HiC data for chr14 from Lieberman-Aiden 2009 (in hg19), subsampled to 10,000 interactions

Description

HiC data for chr14 from Lieberman-Aiden 2009 (in hg19), subsampled to 10,000 interactions

Format

GRangesList

grl.in 25

	-			
or	1		1	r
ъ.	-	•	-	٠

Check intersection of GRangesList with windows on genome

Description

Like only if the ranges in grl[i] intersect «all», «some», «only» windows in the subject

Usage

```
grl.in(grl, windows, some = FALSE, only = FALSE, logical = TRUE,
  exact = FALSE, ignore.strand = TRUE, ...)
```

Arguments

grl	GRangesList object to query for membership in windows
windows	GRanges pile of windows
some	Will return TRUE for GRangesList elements that intersect at least on window range $\left[FALSE\right]$
only	Will return TRUE for GRangesList elements only if there are no elements of query that fail to interesect with windows $[FALSE]$
logical	will return logical otherwise will return numeric vector of number of windows overlapping each grl
	Additional parameters to be passed on to GenomicRanges::findOverlaps

Details

eg can use to identify read pairs whose ends are contained inside two genes)

grı.	pivot

Pivot a GRangesList, inverting "x" and "y"

Description

"Pivots" grl object "x" by returning a new grl "y" whose kth item is gr object of ranges x[[i]][k] for all i in 1:length(x) e.g. If length(grl) is 50 and length of each GRanges element inside is 2, then grl.pivot will produce a length 3 GRangesList with 50 elements per GRanges

Usage

```
grl.pivot(x)
```

Arguments

Χ

GRangesList object to pivot

Details

Assumes all grs in "x" are of equal length

26 grl.string

Examples

```
grl.pivot(grl.hiC)
```

grl.reduce

grl.reduce

Description

Quickly ranges inside grl +/- pad Can use with split / unlist

Usage

```
grl.reduce(grl, pad = 0, clip = FALSE)
```

Arguments

grl GRangesList

pad padding to add to ranges inside grl before reduing

Value

GRangesList with reduced intervals

Author(s)

Marcin Imielinski

Examples

```
grl.reduce(grl, 1000)
unlist(grl.reduce(split(reads+10000, reads$BX)))
```

grl.string

Create string representation of GRangesList

Description

Return ucsc style interval string corresponding to each GRanges in the GRangesList. One line per per GRangesList item. GRanges elements themselves are separated by sep

```
grl.string(grl, mb = FALSE, sep = ",", ...)
```

grl.stripnames 27

Arguments

grl	GRangesList to convert to string vector
mb	Will return as MB and round to "round" [FALSE]
sep	Character to separate single GRanges ranges [,]
	Additional arguments to be passed to gr.string

Value

 $Character\ vector\ where\ each\ element\ is\ a\ \mathsf{GRanges}\ pile\ corresponding\ to\ a\ single\ \mathsf{GRangesList}$ element

Author(s)

Marcin Imielinski

Examples

```
grl.string(grl.hiC, mb=TRUE)
```

grl.stripnames

Remove GRanges names inside a GRangesList

Description

Remove GRanges names inside a GRangesList

Usage

```
grl.stripnames(grl)
```

Arguments

grl GRangesList with names elements

Value

GRangesList where GRanges have no names

28 grl2

grl.unlist

Robust unlisting of GRangesList that keeps track of origin

Description

Does a "nice" unlist of a GRangesList object adding a field grl.ix denoting which element of the GRangesList each GRanges corresponds to and a field grl.iix which saves the (local) index that that gr was in its corresponding GRangesList item

Usage

```
grl.unlist(grl)
```

Arguments

grl

GRangeList object to unlist

Details

In this way, grl.unlist is reversible, while BiocGenerics::unlist is not.

Value

GRanges with added metadata fields grl.ix and grl.iix.

Examples

```
grl.unlist(grl.hiC)
```

grl1

Fake rearrangement data (set 1)

Description

Fake rearrangement data (set 1)

Format

GRangesList

grl2

Fake rearrangement data (set 2)

Description

Fake rearrangement data (set 2)

Format

GRangesList

grlbind 29

grlbind	Concatenate GRangesList objects.

Description

Concatenates GRangesList objects taking the union of their mcols features if they have non-overlapping features

Usage

```
grlbind(...)
```

Arguments

... Any number of GRangesList to concatenate together

Value

Concatenated GRangesList with NA filled in for mcols fields that are non-overlapping. Note that the elements are re-named with sequential numbers

Author(s)

Marcin Imielinski

Examples

```
## Concatenate
grl.hiC2 <- grl.hiC[1:20]
mcols(grl.hiC2)$test = 1
grlbind(grl.hiC2, grl.hiC[1:30])</pre>
```

hg_seqlengths

Output standard human genome seqlengths

Description

Outputs a standard seqlengths for human genome +/- "chr".

Usage

```
hg_seqlengths(genome = NULL, chr = FALSE, include.junk = FALSE)
```

Arguments

genome A BSgenome or object with a seqlengths accessor. Default is hg19, but loads

with warning unless explicitly provided

chr Flag for whether to keep "chr". Default FALSE

include. junk Flag for whether to not trim to only 1-22, X, Y, M. Default FALSE

30 parse.grl

Value

Named integer vector with elements corresponding to the genome seqlengths

Note

A default genome can be set with the environment variable DEFAULT_BSGENOME. This can be the full namespace of the genome e.g.: DEFAULT_BSGENOME=BSgenome.Hsapiens.UCSC.hg19::Hsapiens OR a URL/file path pointing to a chrom.sizes text file (e.g. http://genome.ucsc.edu/goldenpath/help/hg19.chrom.sizes) specifying a genome definition

Author(s)

Marcin Imielinski

parse.gr

parse.gr

Description

quick function to parse gr from character vector IGV / UCSC style strings of format gr1;gr2;gr3 wohere each gr is of format chr:start-end[+/-]

Usage

```
parse.gr(...)
```

Arguments

... arguments to parse.grl i.e. character strings in UCSC style chr:start-end[+-]

Author(s)

Marcin Imielinski

parse.grl

parse.grl

Description

```
parse.grl(x, seqlengths = hg_seqlengths())
```

ra.dedup 31

Arguments

x character vector representing a GRangesList with UCSC style coordinates (chr:start-

end[+-]) representing a [signed] Granges and ";" separators within each item of

x separating individaul each GRAnges

seqlengths named integer vector representing genome (hg_seqlengths() by default)

Author(s)

Marcin Imielinski

Description

Determines overlaps between two or more piles of rearrangement junctions (as named or numbered arguments) +/- padding and will merge those that overlap into single junctions in the output, and then keep track for each output junction which of the input junctions it was "seen in" using logical flag meta data fields prefixed by "seen.by." and then the argument name (or "seen.by.ra" and the argument number)

Usage

```
ra.dedup(grl, pad = 500, ignore.strand = FALSE)
```

Arguments

grl GRangesList representing rearrangements to be merged

pad non-negative integer specifying padding

ignore.strand whether to ignore strand (implies all strand information will be ignored, use at

your own risk)

Value

GRangesList of merged junctions with meta data fields specifying which of the inputs each outputted junction was "seen.by"

Author(s)

Xiaotong Yao

32 ra.merge

ra.duplicated

Show if junctions are Deduplicated

Description

Determines overlaps between two or more piles of rearrangement junctions (as named or numbered arguments) +/- padding and will merge those that overlap into single junctions in the output, and then keep track for each output junction which of the input junctions it was "seen in" using logical flag meta data fields prefixed by "seen.by." and then the argument name (or "seen.by.ra" and the argument number)

Usage

```
ra.duplicated(grl, pad = 500, ignore.strand = FALSE)
```

Arguments

grl GRangesList representing rearrangements to be merged

pad non-negative integer specifying padding

ignore.strand whether to ignore strand (implies all strand information will be ignored, use at

your own risk)

Value

GRangesList of merged junctions with meta data fields specifying which of the inputs each outputted junction was "seen.by"

Author(s)

Xiaotong Yao

ra.merge

Merges rearrangements represented by GRangesList objects

Description

Determines overlaps between two or more piles of rearrangement junctions (as named or numbered arguments) +/- padding and will merge those that overlap into single junctions in the output, and then keep track for each output junction which of the input junctions it was "seen in" using logical flag meta data fields prefixed by "seen.by." and then the argument name (or "seen.by.ra" and the argument number)

```
ra.merge(..., pad = 0, ind = FALSE, ignore.strand = FALSE)
```

ra.overlaps 33

Arguments

	GRangesList representing rearrangements to be merged
pad	non-negative integer specifying padding
ind	logical flag (default FALSE) specifying whether the "seen.by" fields should contain indices of inputs (rather than logical flags) and NA if the given junction is missing
ignore.strand	whether to ignore strand (implies all strand information will be ignored, use at your own risk)

Value

GRangesList of merged junctions with meta data fields specifying which of the inputs each outputted junction was "seen.by"

Examples

```
# generate some junctions
gr1 <- GRanges(1, IRanges(1:10, width = 1), strand = rep(c('+', '-'), 5))
gr2 <- GRanges(1, IRanges(4 + 1:10, width = 1), strand = rep(c('+', '-'), 5))
ra1 = split(gr1, rep(1:5, each = 2))
ra2 = split(gr2, rep(1:5, each = 2))

ram = ra.merge(ra1, ra2)
values(ram) # shows the metadata with TRUE / FALSE flags

ram2 = ra.merge(ra1, ra2, pad = 5) # more inexact matching results in more merging values(ram2)

ram3 = ra.merge(ra1, ra2, ind = TRUE) #indices instead of flags
values(ram3)</pre>
```

ra.overlaps

ra.overlaps

Description

Determines overlaps between two piles of rearrangement junctions ra1 and ra2 (each GRangesLists of signed locus pairs) against each other, returning a sparseMatrix that is T at entry ij if junction i overlaps junction j.

Usage

```
ra.overlaps(ra1, ra2, pad = 0, arr.ind = TRUE, ignore.strand = FALSE, ...)
```

Arguments

ra1	GRangesList with rearrangement set 1
ra2	GRangesList with rearrangement set 2
pad	Amount to pad the overlaps by. Larger is more permissive. Default is exact (0)

34 rle.query

```
arr.ind Default TRUE

ignore.strand Ignore rearrangement orientation when doing overlaps. Default FALSE

... params to be sent to gr.findoverlaps
```

Details

if argument pad = 0 (default) then only perfect overlap will validate, otherwise if pad>0 is given, then padded overlap is allowed o strand matters, though we test overlap of both ra1[i] vs ra2[j] and gr.flip(ra2[j])

rle.query	Queries an RleList representing genomic data
-----------	--

Description

(ie a list whose names represent seqnames ie chromosomes, and lengths represent seqlengths) via GRanges object

Usage

```
rle.query(subject.rle, query.gr, verbose = FALSE, mc.cores = 1,
    chunksize = 1e+09)
```

Arguments

subject.rle Rle query.gr TODO

verbose Set the verbosity of the output

mc.cores Number of cores to apply when doing chunked operation

chunksize Number of query.gr ranges to consider in one memory chunk. 1e9

Value

Rle representing the (concatenated) vector of data (reversing order in case of negative strand input)

Note

Throws warning if seqlengths(gr) do not correspond to the lengths of the RleList components

rrbind 35

rrbind	<pre>Improved rbind for intersecting/union columns of data.frames or data.tables</pre>

Description

Like rbind, but takes the intersecting columns of the data.

Usage

```
rrbind(..., union = TRUE, as.data.table = FALSE)
```

Arguments

... Any number of data. frame or data. table objects

union Take union of columns (and put NA's for columns of df1 not in df2 and vice

versa). [TRUE]

as.data.table Return the binded data as a data.table. [FALSE]

Value

data.frame or data.table of the rbind operation

Author(s)

Marcin Imielinski

seg2gr

Convert GRange like data.frames into GRanges

Description

Take data frame of ranges "segs" and converts into granges object porting over additional value columns "segs" data frame can obey any number of conventions to specify chrom, start, and end of ranges (eg \$pos1, \$pos2, \$Start_position, \$End_position) -> see "standardize_segs" for more info

Take data frame of ranges "segs" and converts into granges object porting over additional value columns "segs" data frame can obey any number of conventions to specify chrom, start, and end of ranges (eg \$pos1, \$pos2, \$Start_position, \$End_position) -> see "standardize_segs" for more info

```
seg2gr(segs, seqlengths = NULL, seqinfo = Seqinfo())
standardize_segs(seg, chr = FALSE)
```

36 si2gr

Arguments

segs data frame of segments with fields denoting chromosome, start, end, and other

metadata (see standardized segs for seg data frame input formats)

seqlengths seqlengths of output GRanges object seqinfo seqinfo of output GRanges object

segs data frame of segments with fields denoting chromosome, start, end, and other

metadata (see standardized segs for seg data frame input formats)

seqlengths seqlengths of output GRanges object seqinfo seqinfo of output GRanges object

Details

standardize_segs
(data frame seg function)

Takes and returns segs data frame standardized to a single format (ie \$chr, \$pos1, \$pos2)

if chr = TRUE will ensure "chr" prefix is added to chromossome(if does not exist)

si

Seqinfo object for hg19

Description

Seqinfo object for hg19

Format

Seqinfo

si2gr

Create GRanges from Seqinfo or BSgenome

Description

Creates a genomic ranges from seqinfo object ie a pile of ranges spanning the genome

Usage

```
si2gr(si, strip.empty = FALSE)
```

Arguments

si Seqinfo object or a BSgenome genome

strip.empty Don't know. [FALSE]

Value

GRanges representing the range of the input genome

streduce 37

Examples

```
si2gr(BSgenome.Hsapiens.UCSC.hg19::Hsapiens)
```

streduce

Reduce GRanges and GRangesList to miminal footprint

Description

```
Shortcut for reduce(sort(gr.stripstrand(unlist(x))))
```

Usage

```
streduce(gr, pad = 0, sort = TRUE)
```

Arguments

gr GRanges or GRangesList

pad Expand the input data before reducing. [0]

sort Flag to sort the output. [TRUE]

Value

GRanges object with no strand information, representing a minimal footprint

Examples

```
streduce(grl.hiC, pad=10)
streduce(example_genes, pad=1000)
```

%&%

subset x on y ranges wise ignoring strand

Description

```
shortcut for x[gr.in(x,y)]
gr1
Shortcut for gr.in
gr1
Shortcut for gr.in (standard arguments)
gr1
```

Usage

```
x %&% ...
x %^^% ...
```

38 %&&%

Arguments

X	See gr.in
	See gr.in
Х	GRanges object
	additional arguments to gr.in
х	See gr.in
	See gr.in

Value

subset of gr1 that overlaps gr2f

logical vector of length gr1 which is TRUE at entry i only if gr1[i] intersects at least one interval in gr2

logical vector of length gr1 which is TRUE at entry i only if gr1[i] intersects at least one interval in gr2 (strand agnostic)

Author(s)

Marcin Imielinski

Marcin Imielinski

%&&%

Subset x on y ranges wise respecting strand

Description

```
shortcut for x[gr.in(x,y)] gr1
```

Usage

```
x %&&% ...
```

Value

subset of gr1 that overlaps gr2

Author(s)

%+%

%+%

Nudge GRanges right

Description

Operator to shift GRanges right "sh" bases

Usage

```
gr %+% ...
```

Value

shifted granges

Author(s)

Marcin Imielinski

%-%

Shift GRanges left

Description

Operator to shift GRanges left "sh" bases

df

Usage

```
gr %-% ...
```

Value

shifted granges

Author(s)

40 %_%

%Q%

query ranges by applying an expression to ranges metadata

Description

gr

Usage

```
## S4 method for signature 'GRanges' x \%0\% y
```

Arguments

x GRanges to match against a query GRanges

y GRanges with metadata to be queried

Value

subset of gr that matches query

Author(s)

Marcin Imielinski

%_%

BiocGenerics::setdiff shortcut (strand agnostic)

Description

```
Shortcut\ for\ {\tt BiocGenerics::setdiff}
```

```
gr1 <- GRanges(1, IRanges(10,20), strand="+") gr2 <- GRanges(1, IRanges(15,25), strand="-") gr3 <- "1:1-15" gr1 gr1
```

More robust and faster implementation of GenomicRangs::setdiff

Robust to common edge cases of setdiff(gr1, gr2) where gr2 ranges are contained inside gr1's (yieldings setdiffs yield two output ranges for some of the input gr1 intervals.

Usage

```
x %_% ...
gr.setdiff(query, subject, ignore.strand = TRUE, by = NULL, ...)
```

%O% 41

Arguments

x GRanges object to to

. . . A GRanges or a character to be parsed into a GRanges

query GRanges object as query subject GRanges object as subject

max.slice Default Inf. If query is bigger than this, chunk into smaller on different cores

verbose Default FALSE

mc.cores Default 1. Only works if exceeded max.slice
... arguments to be passed to gr.findoverlaps

Value

GRanges representing setdiff of input interval returns indices of query in subject or NA if none found

Author(s)

Marcin Imielinski

%0%

gr.val shortcut to get fractional overlap of gr1 by gr2, ignoring strand

Description

```
Shortcut for gr.val (using val = names(values(y))) gr1

gr.findoverlaps (respects strand)

Description

Shortcut for gr.findoverlaps

gr1

Usage

```
x %**% ...
```

Arguments

x See gr.findoverlaps

... See gr.findoverlaps

Value

new granges containing every pairwise intersection of ranges in gr1 and gr2 with a join of the corresponding metadata

Author(s)

46

Description

Shortcut for gr.findoverlaps with qcol and scol filled in with all the query and subject metadata names. This function is useful for piping GRanges operations together. Another way to think of join of the metadata, with genomic coordinates as the keys.

Example usage:

X

Usage

```
## S4 method for signature 'GRanges, ANY' x ^{**} y
```

Arguments

x GRangesy GRanges

Value

GRanges containing every pairwise intersection of ranges in x and y with a join of the corresponding metadata

Author(s)

Marcin Imielinski
